A: what have you done to check if the permissions are correct for the folder "PhotoRecoveryLogs"? if not, this directory should be created by you (well, by the "RecoveryLogs" group) Q: Matrix free interpolation in scipy Is there a matrix free interpolation function in scipy? I have a grid of data x and y and wish to interpolate it to create a new grid of data x' and y'. It's easy to do by matrix multiplication or interpolation for linear interpolation, but I was wondering if it is possible to do it without a matrix. This was asked earlier and the answer is no, at least not in SciPy 1.0.0. However, it is easy to implement a custom interpolator:

```
import numpy as np from scipy.interpolate import InterpolatedUnivariateSpline from scipy.interpolate import RegularGridInterpolator def linear_matrix_free(x, y, xprime, yprime): """ Custom interpolator for linear interpolation with no matrix involved. points = np.stack([x, y], 2) spl = InterpolatedUnivariateSpline(points, 2) return RegularGridInterpolator(spl, x, y, xprime, yprime) Alternatively, we can just use scipy.interpolate.InterpolatedUnivariateSpline: def spline_matrix_free(x, y, xprime, yprime): spl = scipy.interpolate.InterpolatedUnivariateSpline(points, 2) This is clearly preferable because it supports methods that the other interpolators lack, e.g. spline_matrix_free(x, y, xprime, yprime).optimize(x) You can implement it yourself. 82157476af
